OBSERVATIONS OF A VARIABLE RADIO SOURCE ASSOCIATED WITH THE PLANET JUPITER

BY B. F. BURKE AND K. L. FRANKLIN

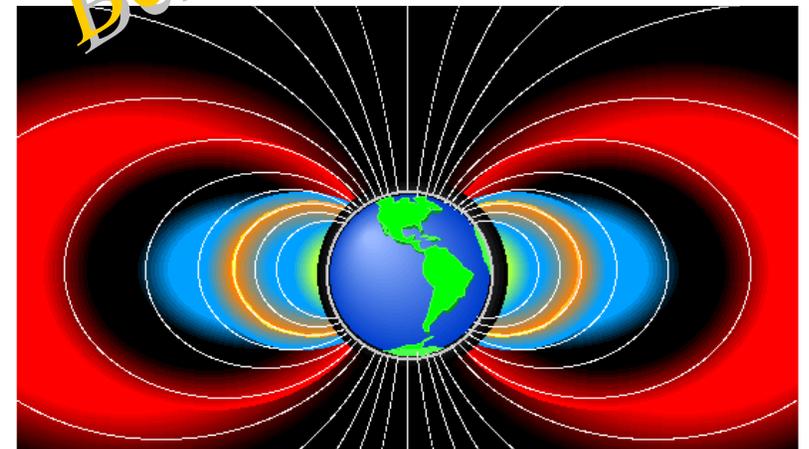

*Department of Terrestrial Magnetism, Carnegie Institution of Washington,
Washington 15, D. C.*

(Received April 15, 1955)

ABSTRACT

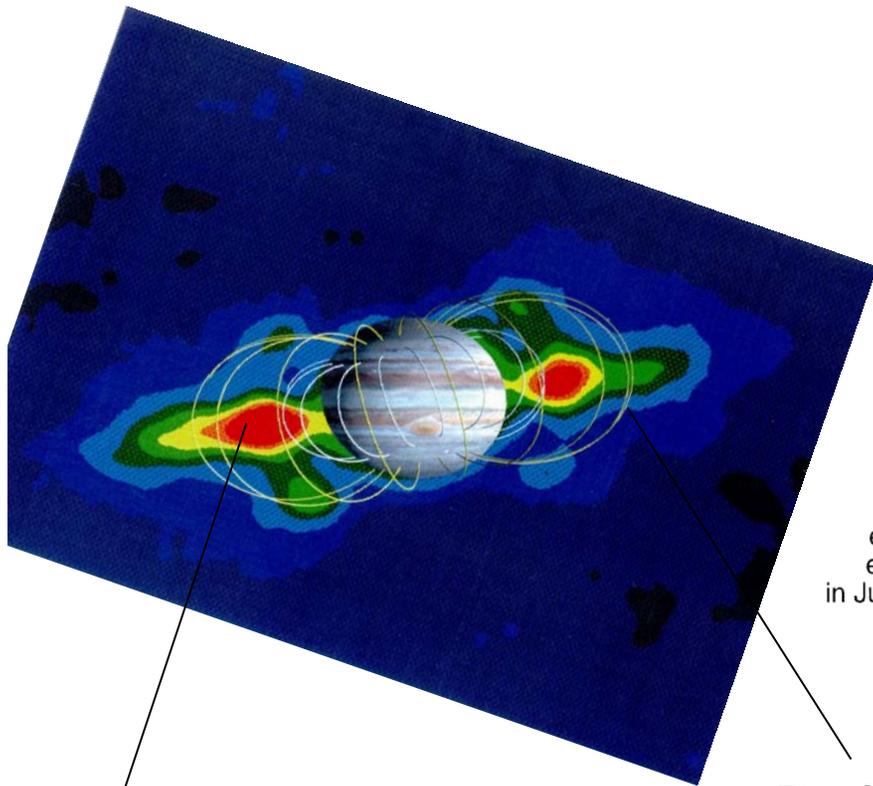

A source of variable 22.2-Mc/sec radiation has been detected with the large "Mills Cross" antenna of the Carnegie Institution of Washington. The source is present on nine records out of a possible 31 obtained during the first quarter of 1955. The appearance of the records of this source resembles that of terrestrial interference, but it lasts no longer than the time necessary for a celestial object to pass through the antenna pattern. The derived position in the sky corresponds to the position of Jupiter and exhibits the geocentric motion of Jupiter. There is no evident correlation between the times of appearance of this phenomenon and the rotational period of the planet Jupiter, or with the occurrence of solar activity. There is evidence that most of the radio energy is concentrated at frequencies lower than 38 Mc/sec.

Jupiter Radio Emission Discovered in 1955

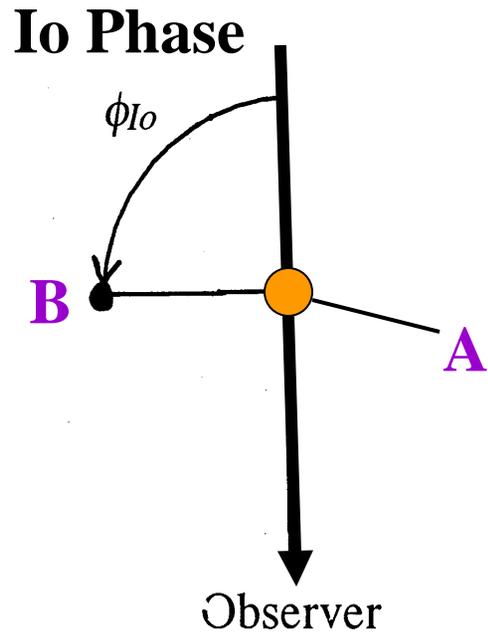

- Jupiter has a magnetic field
- Trapped electrons

$$f_{\max} \sim 40 \text{ MHz}$$

$$f = f_c = \frac{qB}{2\pi m}$$

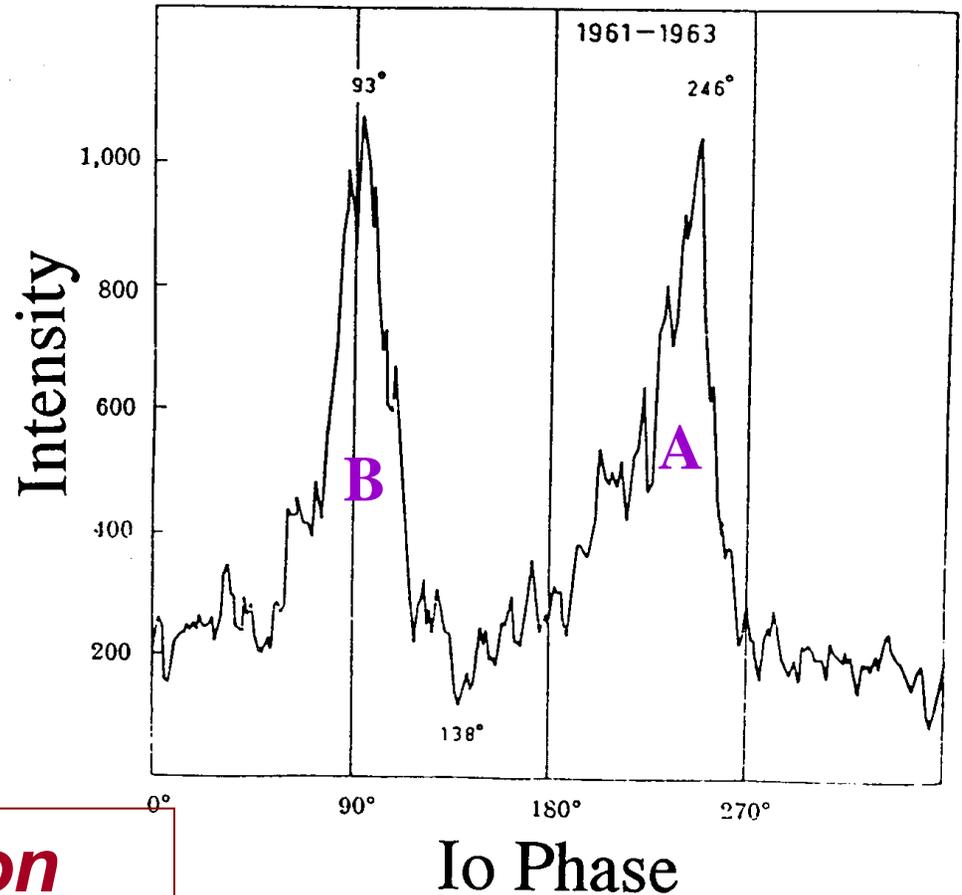

$$\rightarrow B_{\max} \sim 14 \text{ G}$$

Early Discoveries

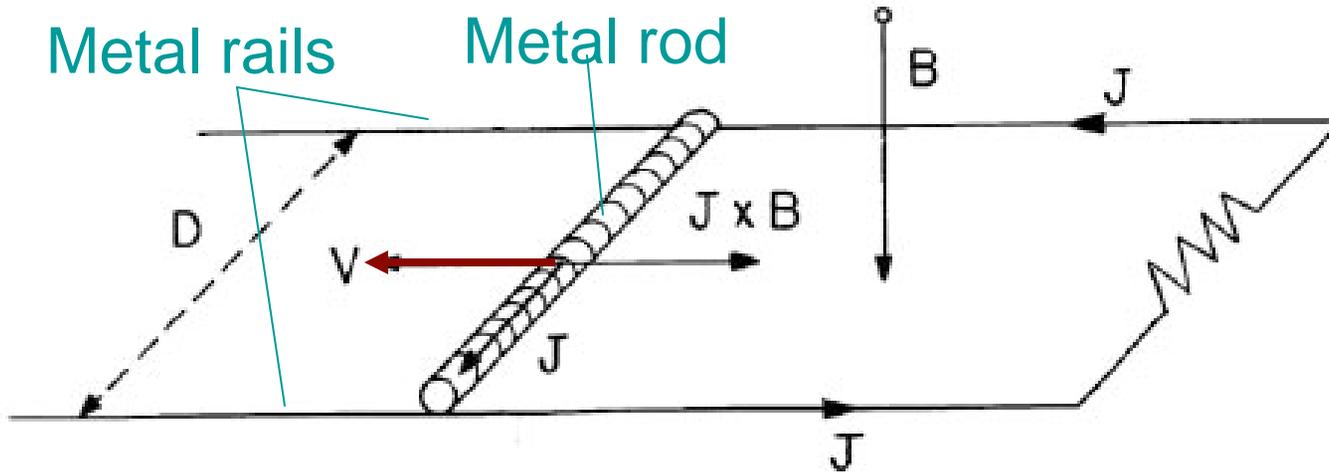

Io's Orbital Period = 42 hours

Bigg (1964)

***Jupiter's Radio Emission
Controlled by Location of Io***

Early Explanations

*Goldreich
& Lyndon-
Bell (1969)*

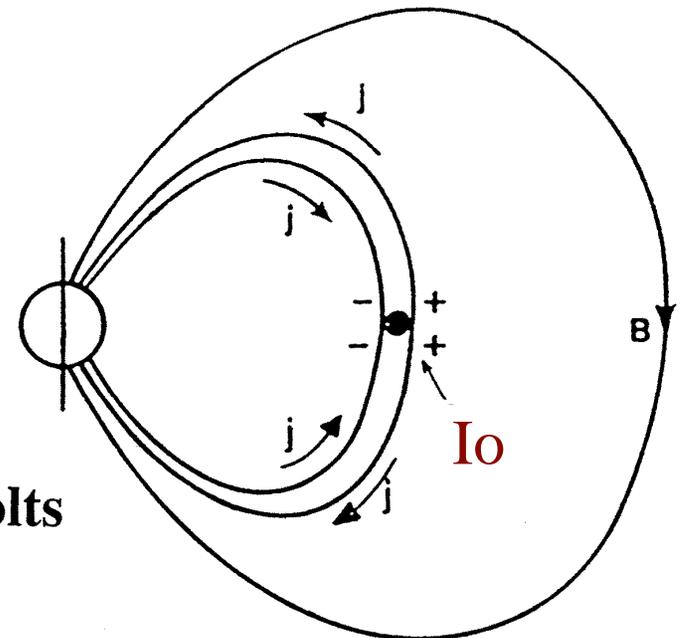

Conductor moving
in magnetic field

Piddington & Drake (1968)

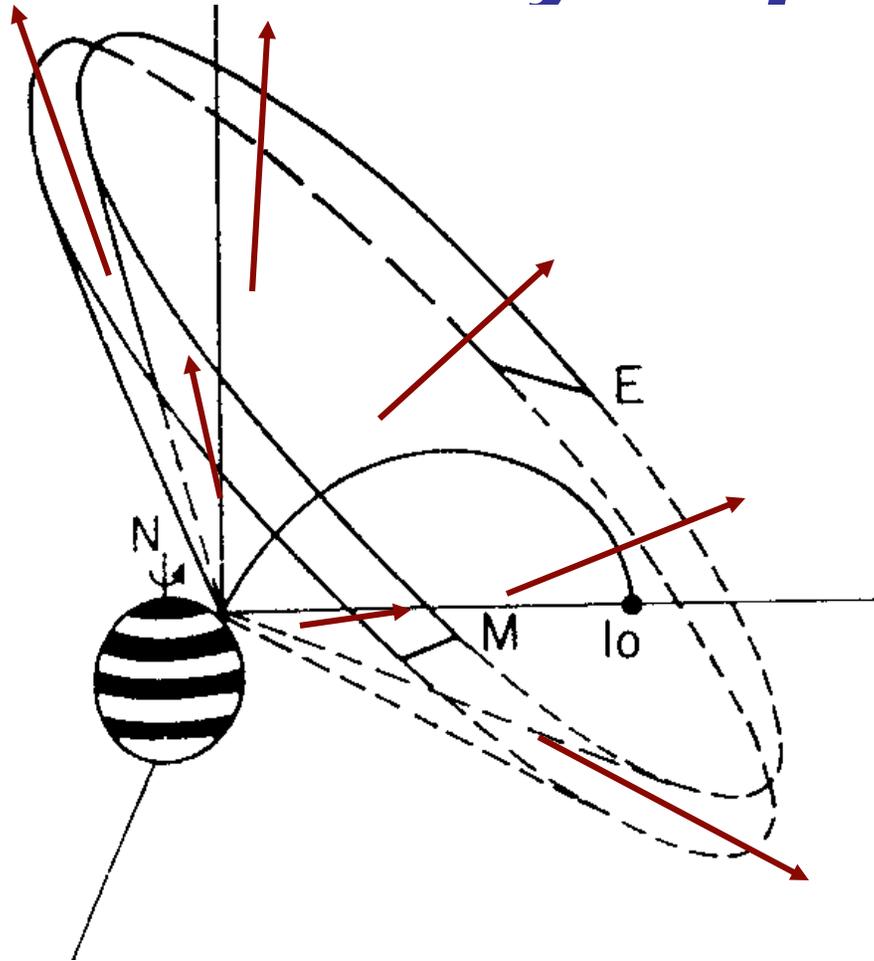

$$\underline{E} = -\underline{V} \times \underline{B}$$

$$V = 57 \text{ km s}^{-1}$$

$$\phi = 2 R_{I_0} E = 400 \text{ kVolts}$$

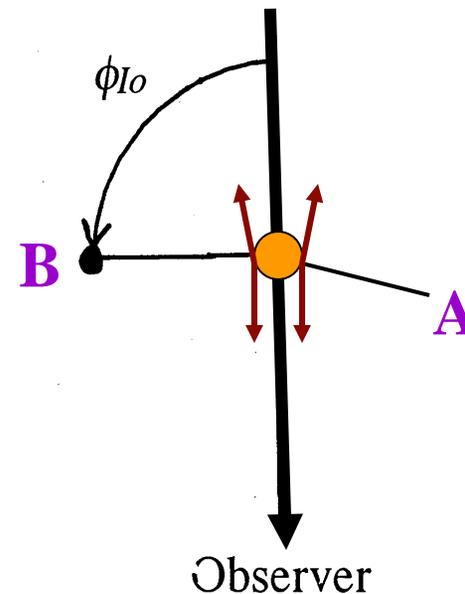

Early Explanations

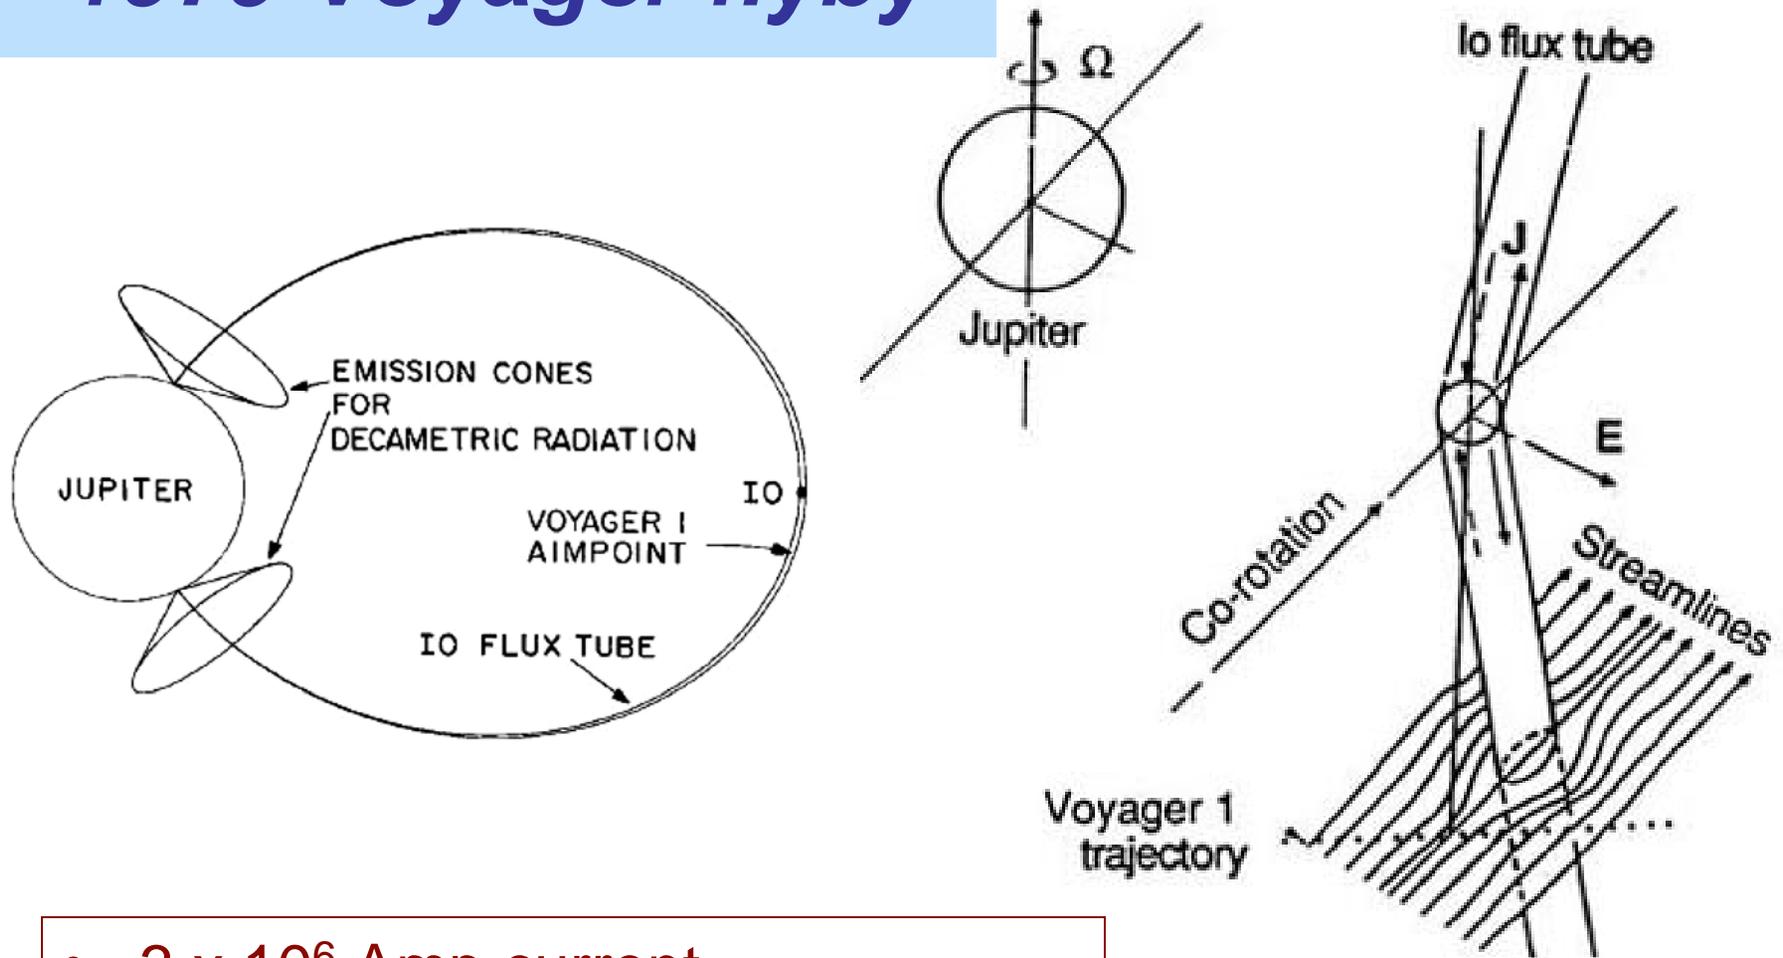

Dulk (1965)

Radio emission
beamed in a wide
hollow cone on field
line connected to Io
by a current loop

1979 Voyager flyby

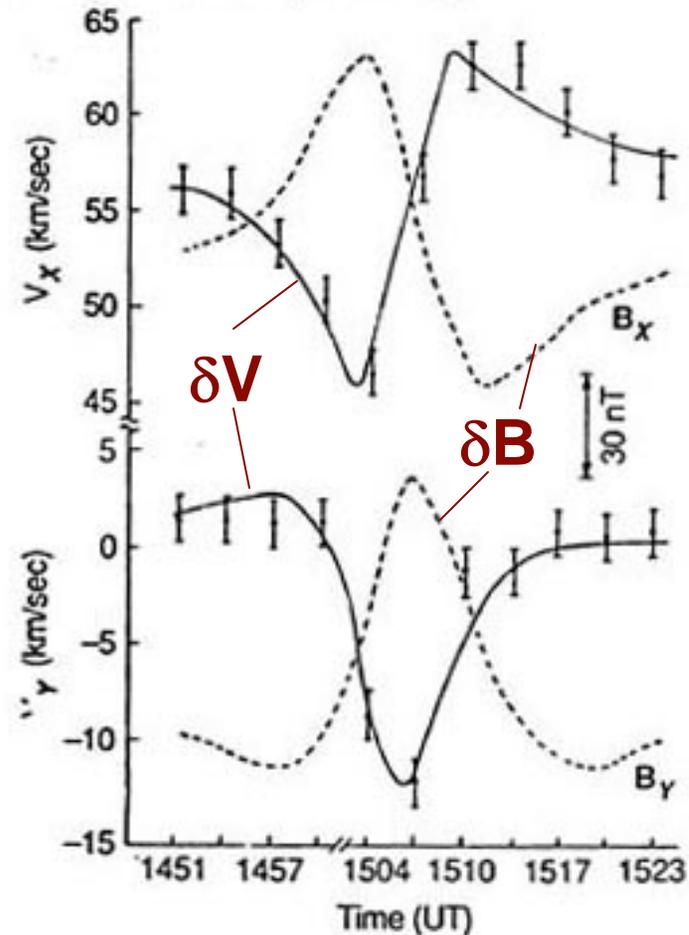

- $\sim 3 \times 10^6$ Amp current
- $\delta\mathbf{B}$, $\delta\mathbf{V}$ consistent with Alfvén wave

1979 Voyager flyby - The Io Alfvén Wave

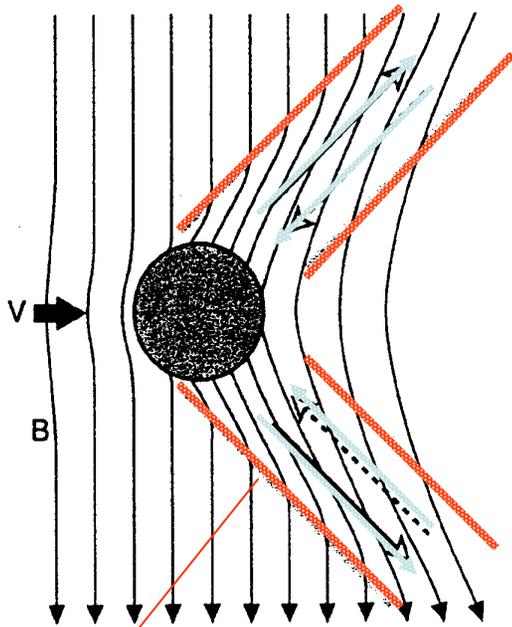

Belcher et al. (1981) *Acuna et al. (1981)*

$$\delta \mathbf{B} / B = - \delta \mathbf{V} / V_A$$

$$V_A = B / (\mu_0 \rho)^{1/2}$$

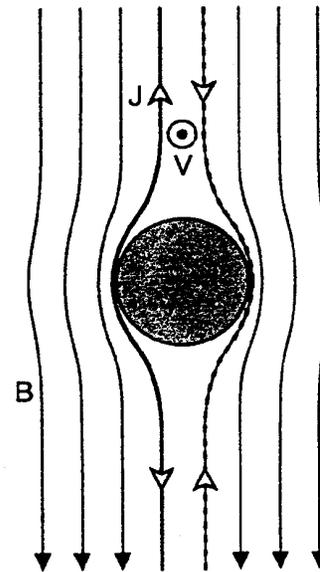

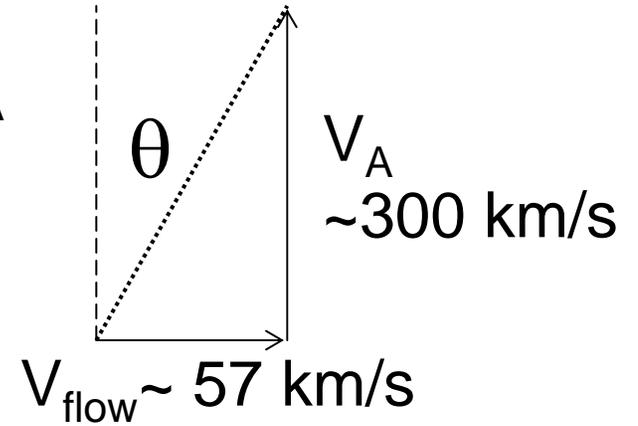

Looking From Side

Alfvén wing / wave front / characteristic

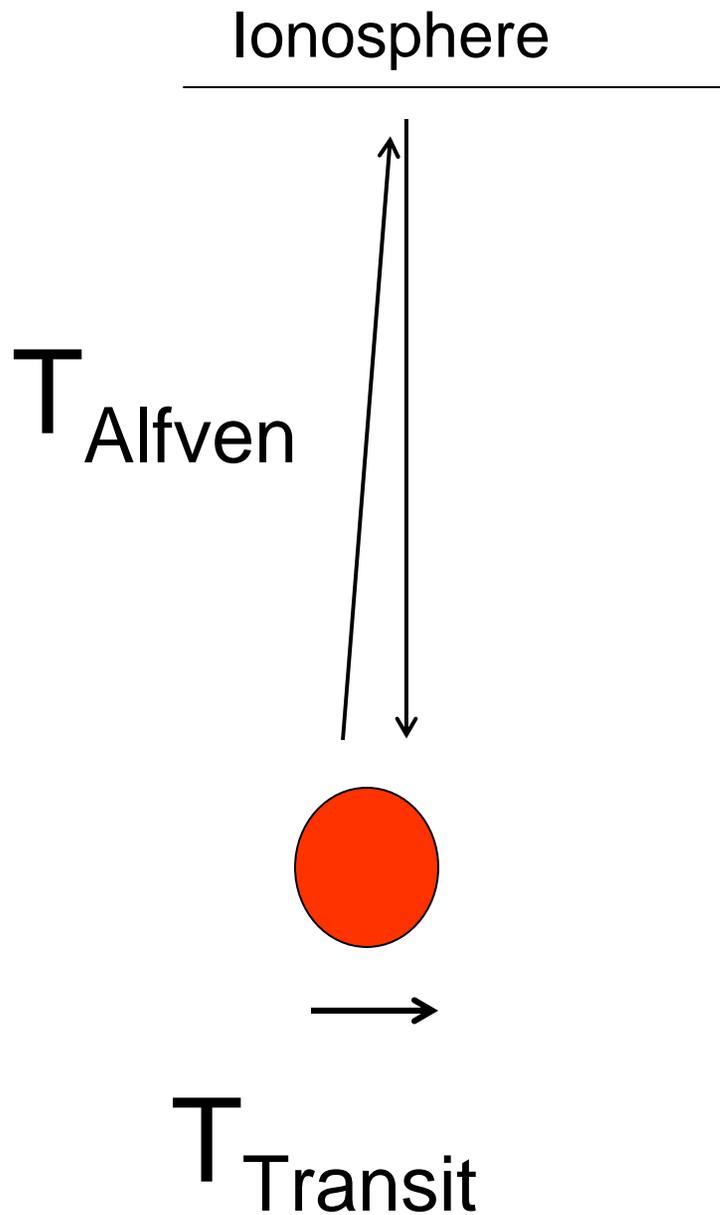

$$\theta \sim V_{\text{flow}} / V_A$$

$$\sim 10^\circ$$

Looking Upstream

Goertz 1980; Neubauer 1980
 Southwood & Kivelson
 Belcher 1987

Alfvenic Interaction

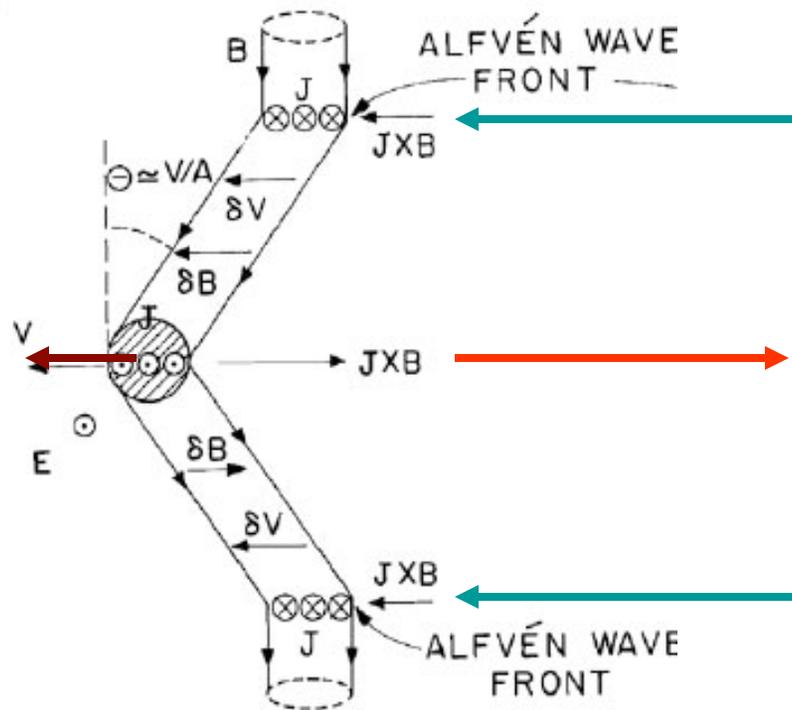

$$T_{\text{alfven}} > T_{\text{Transit}}$$

DC Current Loop

$$T_{\text{alfven}} < T_{\text{Transit}}$$

Momentum Coupling by Alfvén Wave

Motion of Io relative to plasma

Slowing of ambient plasma

Acceleration of Io Relative to Io orbital motion

Slowing of ambient plasma

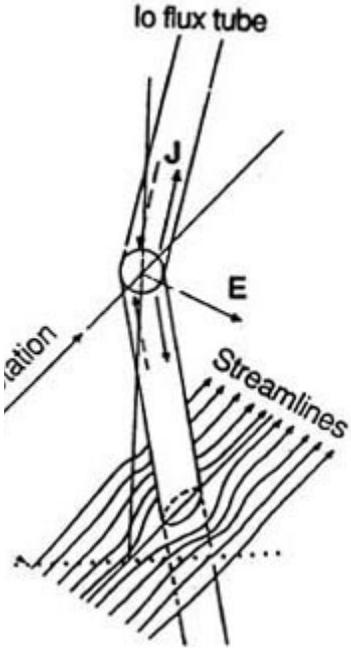

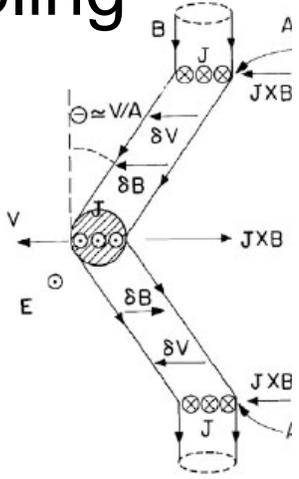

- $F \sim 10^6$ N
- \sim thrust of a Saturn V booster
- Only moves Io few km outwards in age of solar system

*Drell, Foley &
Ruderman 1965*

Explained drag
on Echo 1 as
Alfven wave
drag

Echo 1 sits fully inflated at a Navy hangar in Weeksville, North Carolina. The spacecraft measured 100 feet across when deployed, and was nicknamed a 'satelloon' by those involved in the project. Echo 1 was launched August 12, 1960, into an orbit with an Apogee of 1684 km, a Perigee of 1523 km and an Inclination of 47.2 degrees. The mylar film balloon acted as a passive communications reflector for transcontinental and intercontinental telephone (voice), radio and television signals. Echo 1 re-entered the atmosphere May 24, 1968

1983

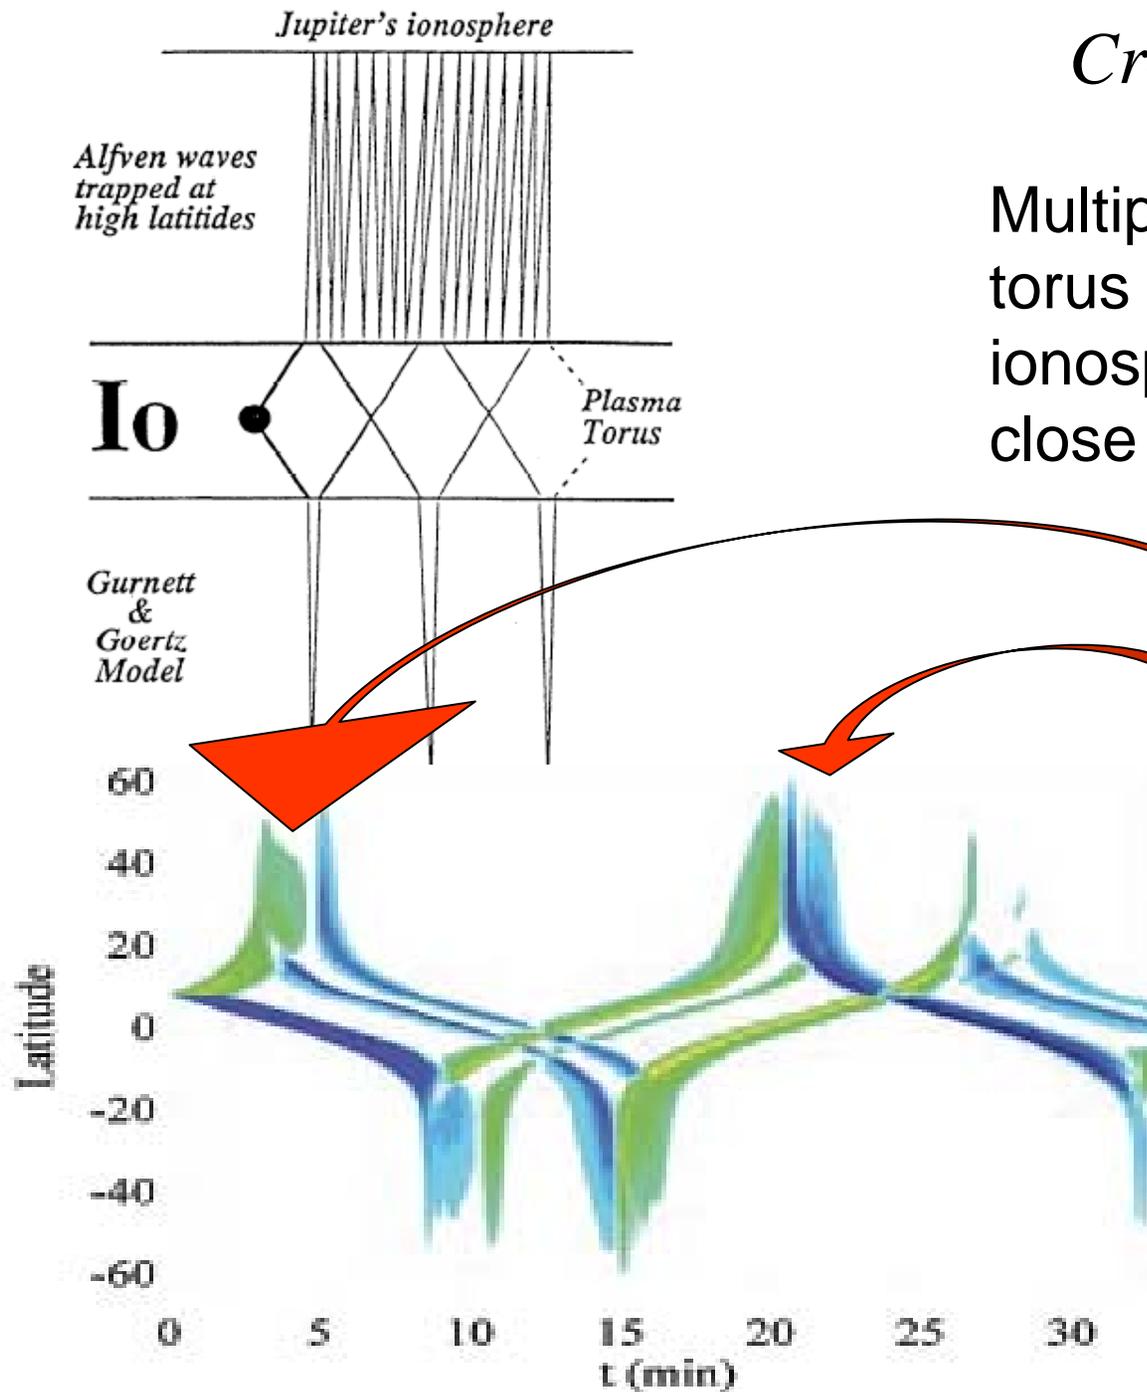

- *Repeated patterns of arcs in frequency-time spectrographs*

- *Indicates systematic beaming pattern, controlled by the geometry of Jupiter's magnetic field*

- *And location of Io...*

Crary & Bagenal 1997

Multiple bounces between torus and Jupiter's ionosphere would explain close space of radio arcs

This is what 1-D modeling of kinetic alfvén waves is beginning to produce...

Lysak et al. 2006

Model Equations *Lysak et al. 2006*

- Wave modeling based on Maxwell's equations:

$$\epsilon \frac{\partial \mathbf{E}_{\perp}}{\partial t} = \frac{1}{\mu_0} (\nabla \times \mathbf{B})_{\perp} - \mathbf{j}_{\perp} \qquad \frac{\partial \mathbf{B}}{\partial t} = -\nabla \times \mathbf{E}$$

- Current represents source due to I_0 , dielectric constant is:

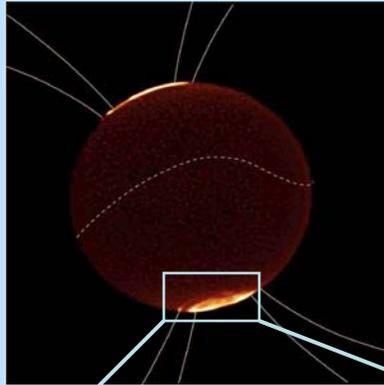

$$\epsilon = \epsilon_0 \left(1 + \frac{c^2}{V_A^2} \right)$$

- where the Alfvén speed profile is given by the models above.
- These equations are cast in dipole coordinates, and the Green's function for this system is found using Sturm-Liouville theory, assuming I_0 is essentially a point source.
- The Poynting flux delivered to the ionosphere can then be calculated as a function of frequency and the location of I_0 on the flux tube.

- Ballistic trajectories with fallout time of ~30 mins

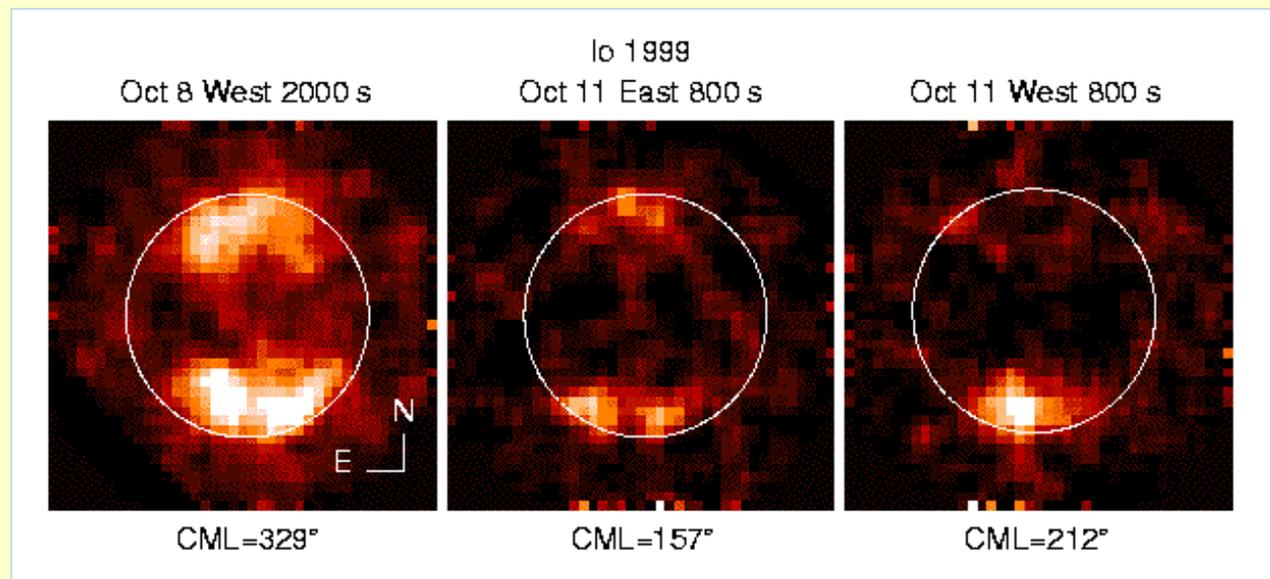

1998 observations

Because SO₂ gas absorbs strongly at 1215Å, Lyman-α images provide a map of the SO₂ atmosphere on Io. Dark=more SO₂ gas.

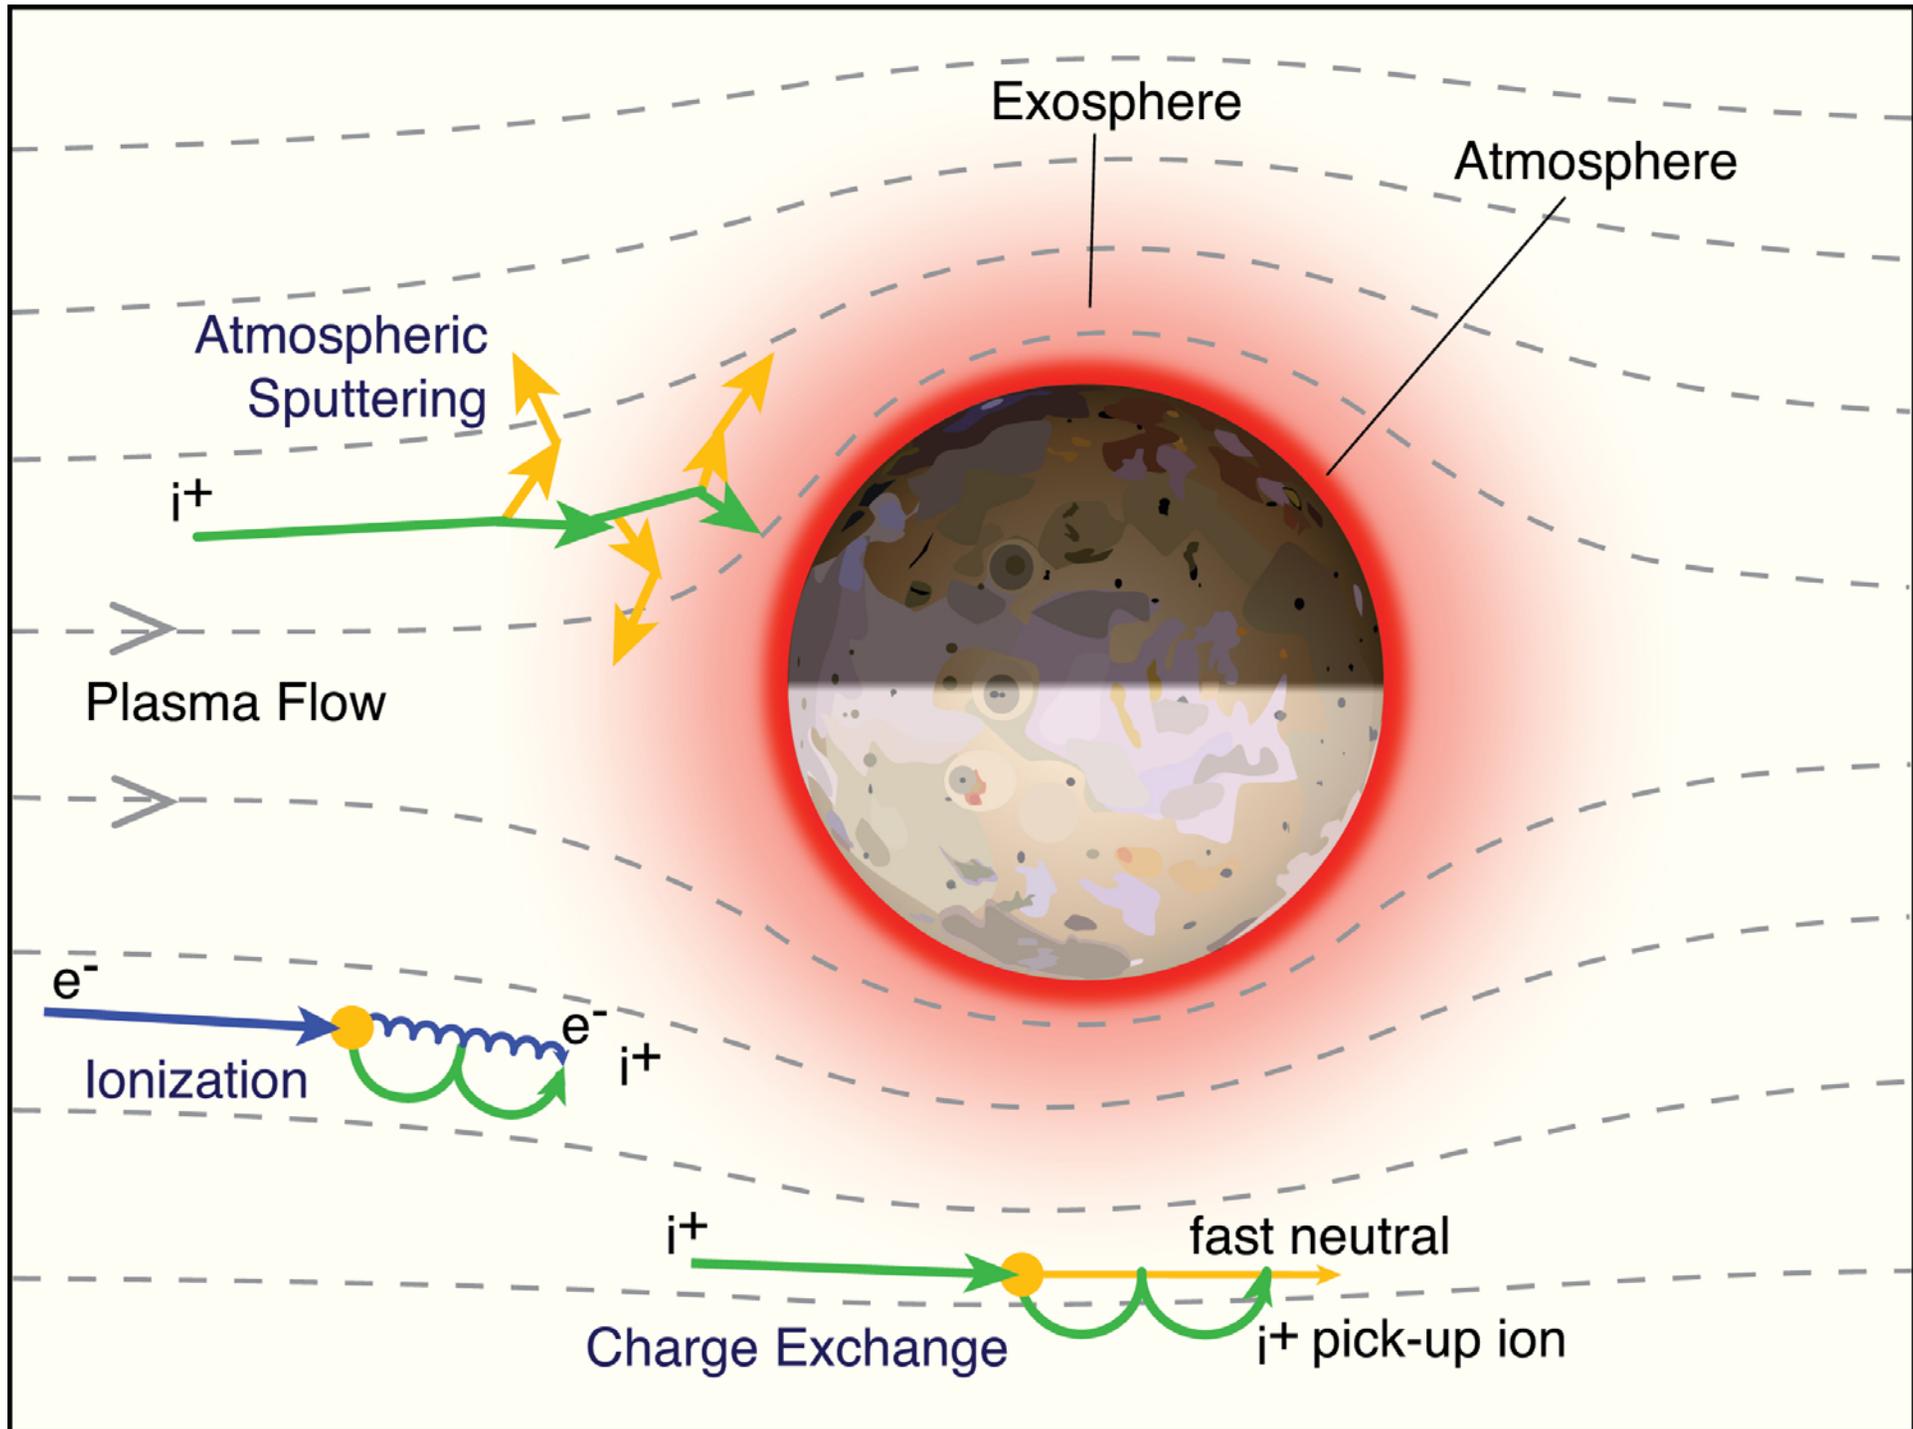

Lyman-α Images → $\mathcal{N}_{\text{SO}_2} \sim \text{few} \times 10^{16} \text{ cm}^{-2}$

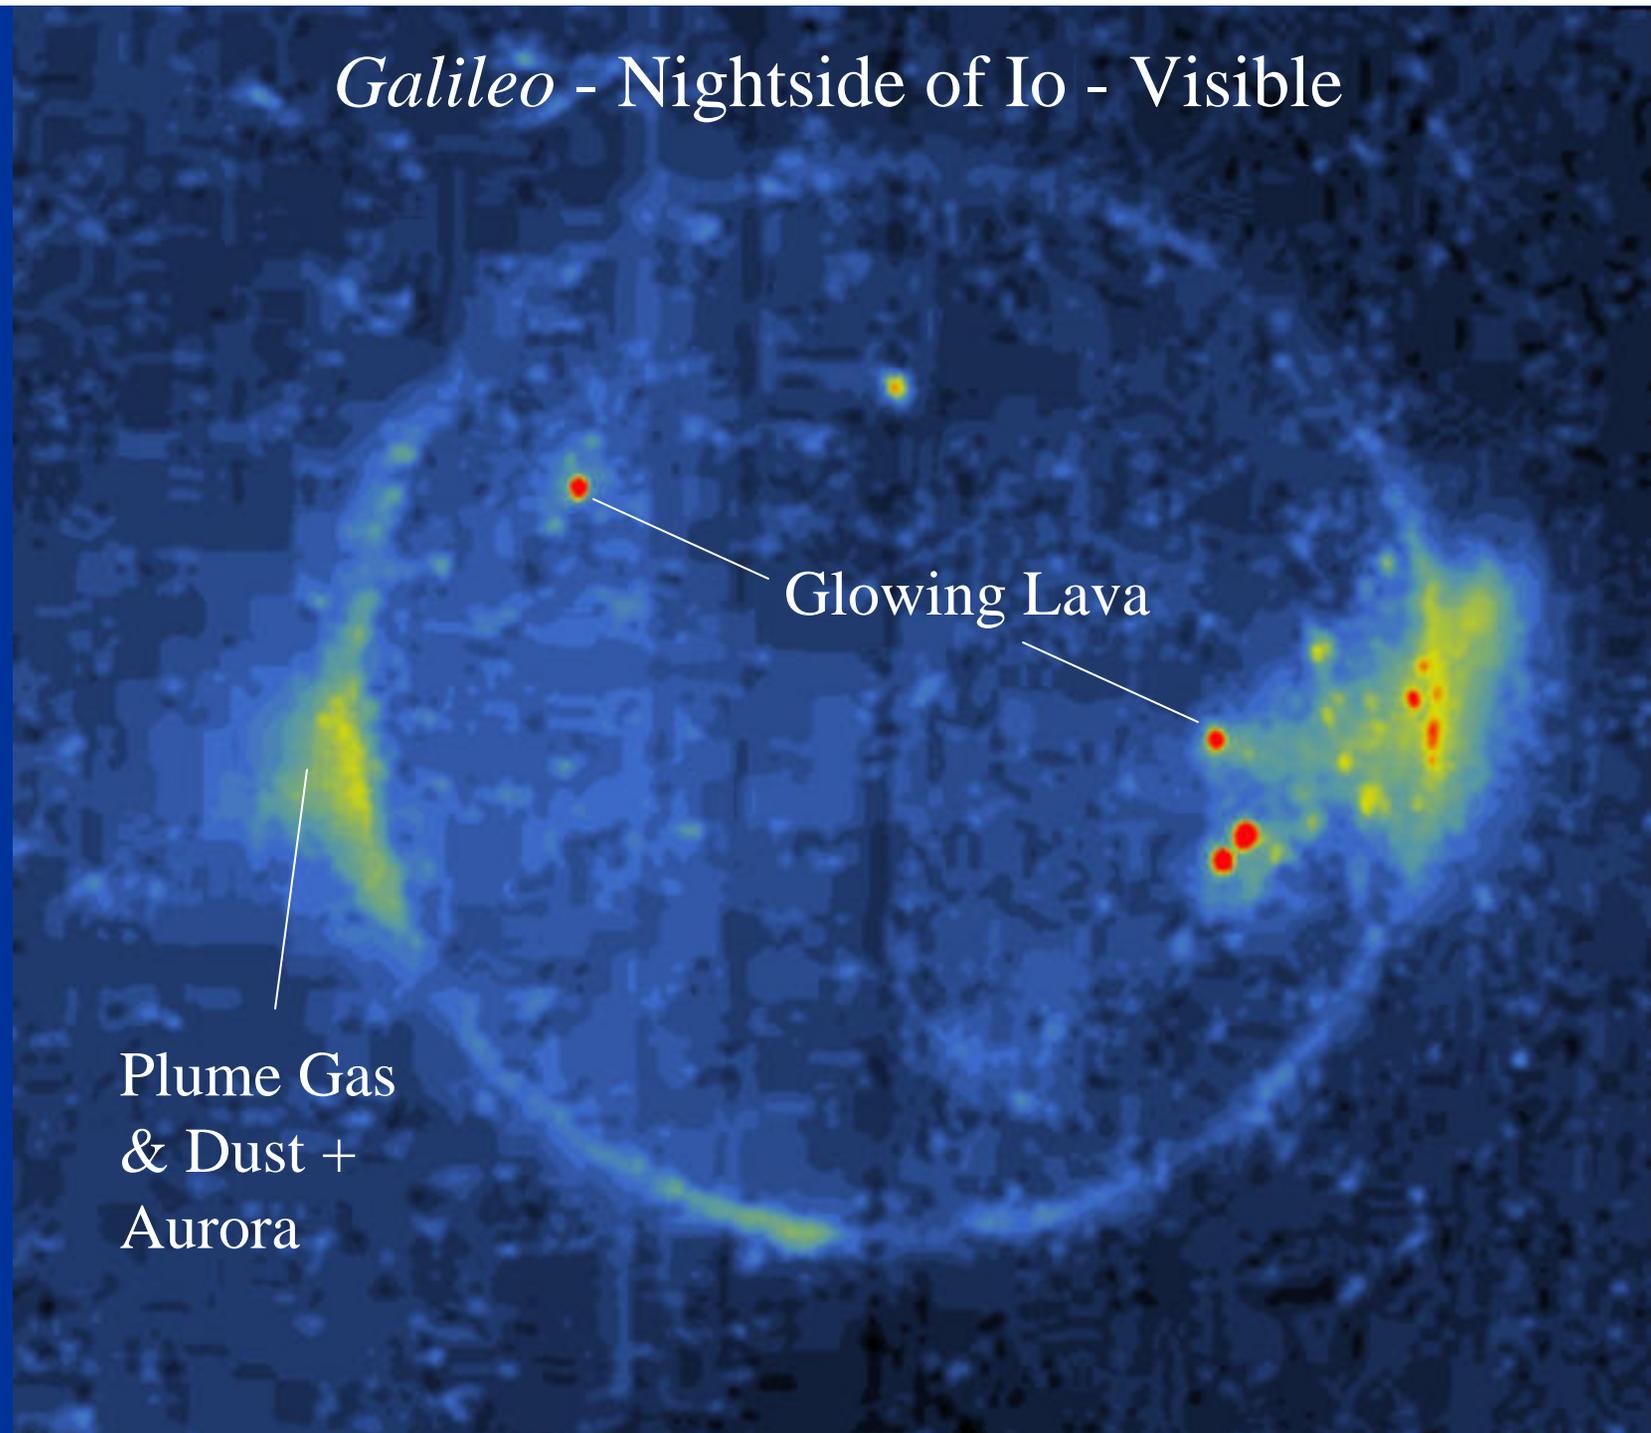

Note the pronounced variability in the inferred abundance and distribution of the gas between 1998 & 1999. It is unclear at present whether this variability is temporal or longitudinal.

Local Io Source

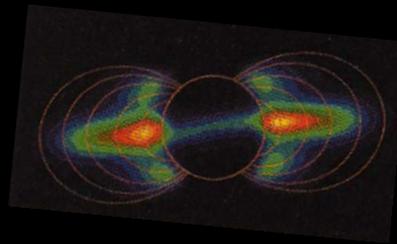

Total ion source $200-900 \text{ kg s}^{-1}$ - Mostly far from Io

Io Plasma torus

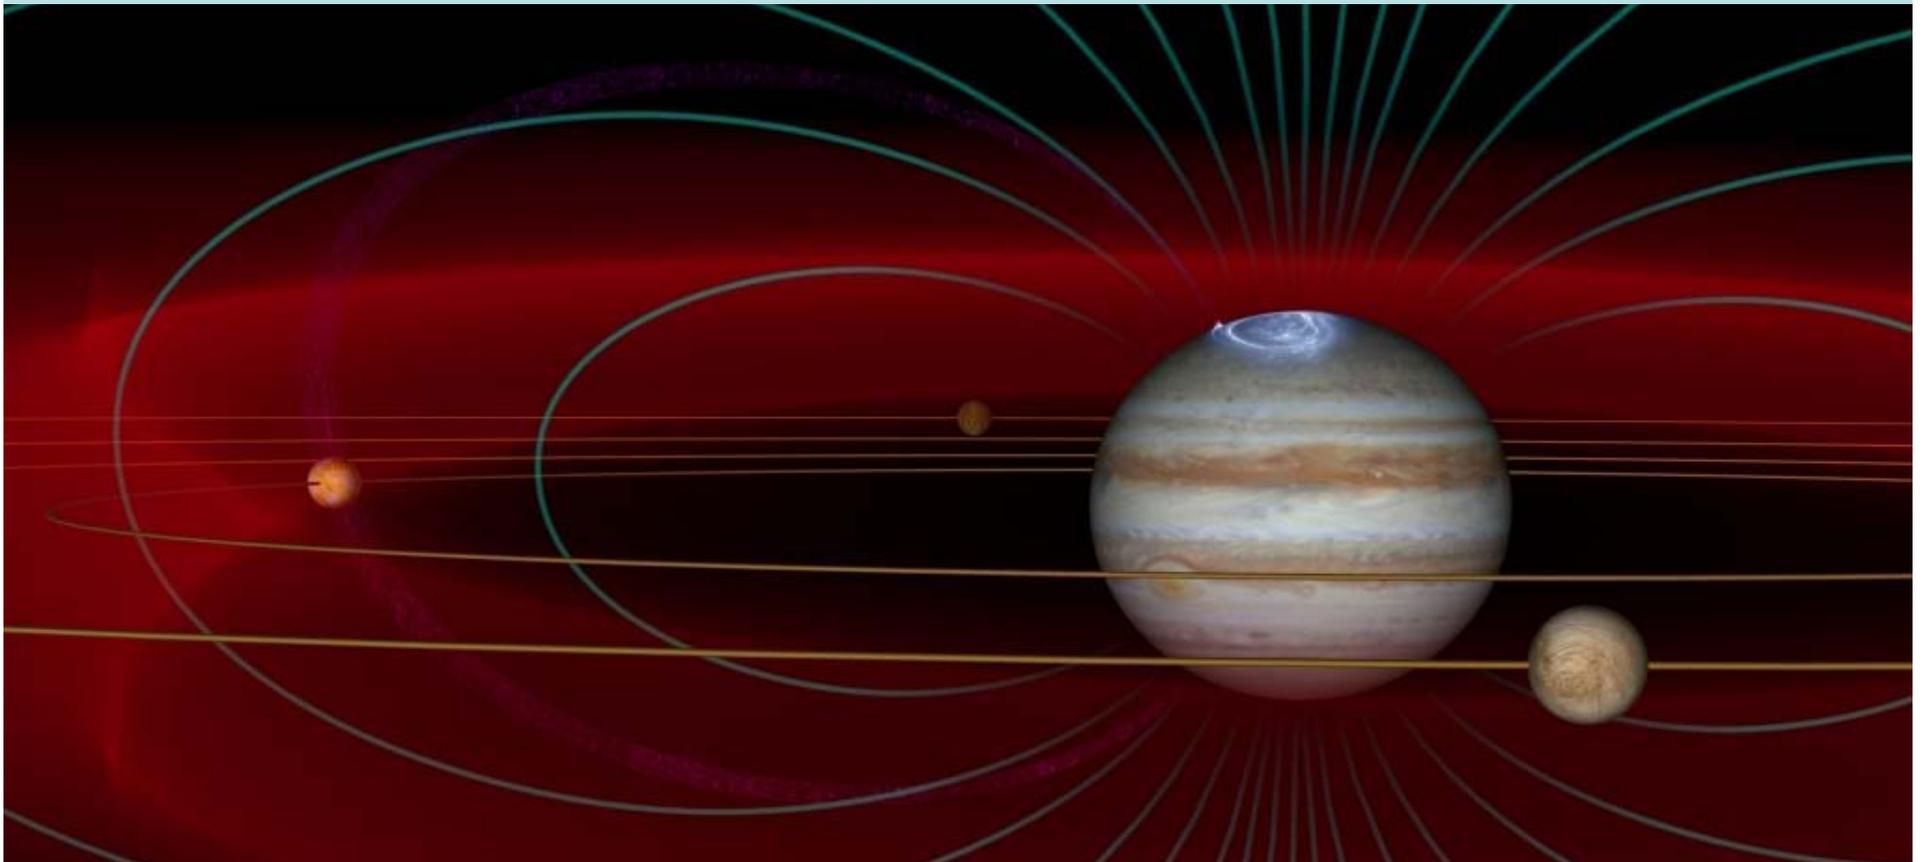

Total mass ~ 2 Mton
Source @ ~ 1 ton/s
 $\sim 3 \times 10^{28}$ ions/s
replaced in 23 days

Io Plasma torus:

Total mass ~ 2 Mton

Source @ 1 ton/s replaced in 23 days

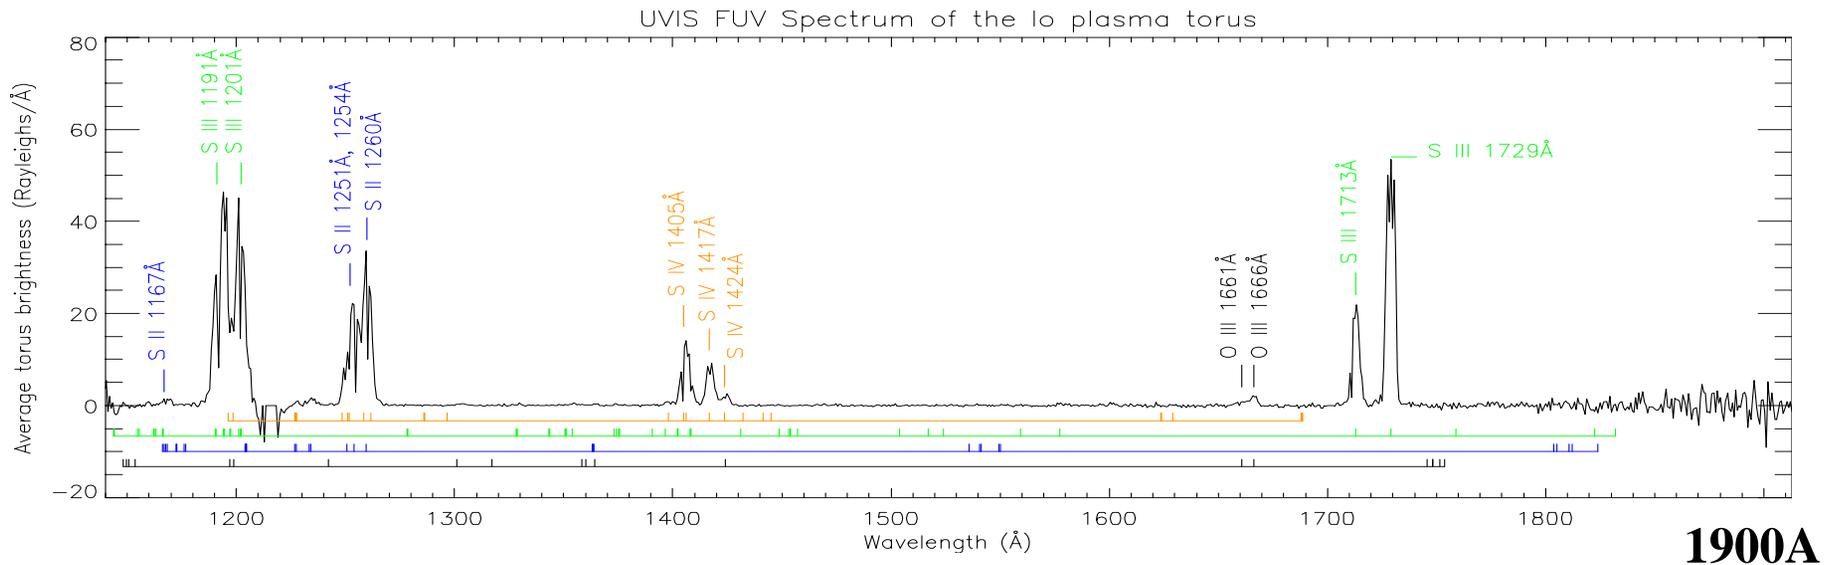

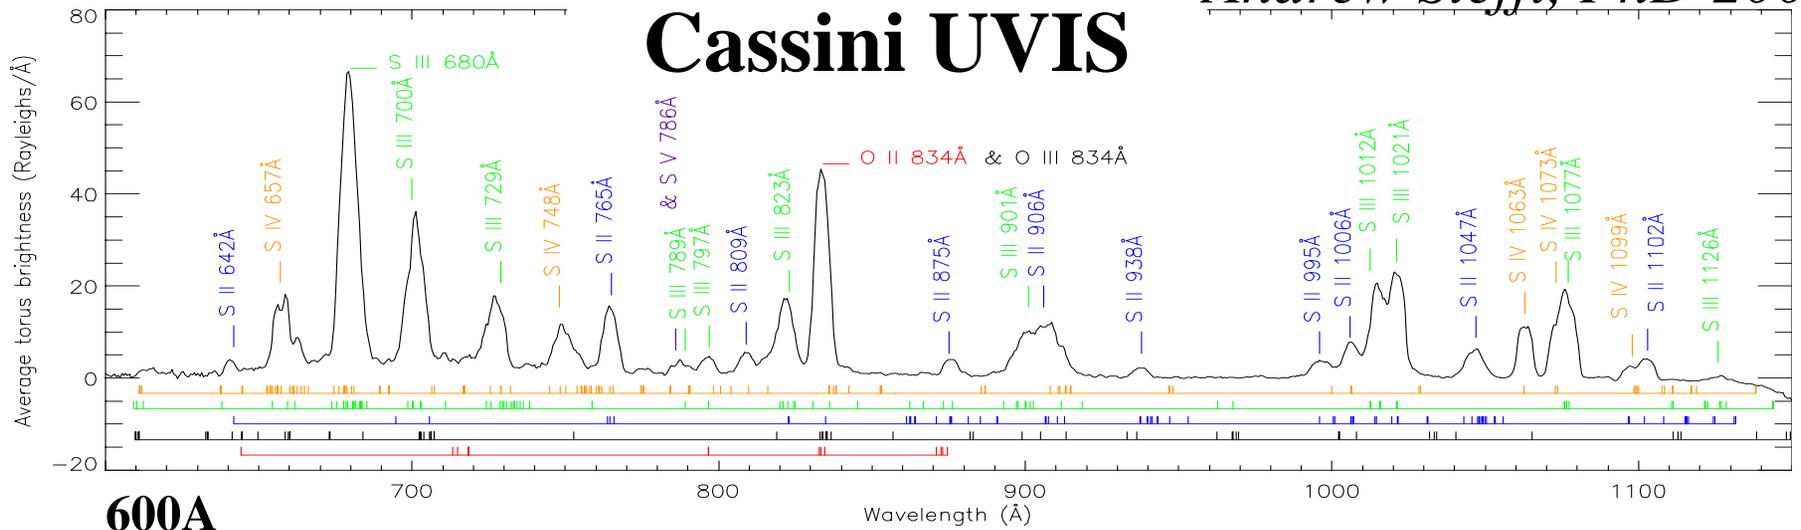

Total thermal energy $\sim 6 \times 10^{17}$ J

UV power @ 1.5 terawatt cools electrons in ~ 7 hours

Ion pick-up @ 2 terawatt generates total energy in 4 days

How do composition, temperatures & UV power vary?

Andrew Steffl, PhD 2005

Torus Chemistry Models

Neutral Cloud Theory:

Source = atomic O, S
Ionization, Charge Exchange,
Recombination
Radiative Cooling
Ion-Electron coupling -
Coulomb collisions

Electron heating:

Necessary to provide UV
emitted power

Usually specified as

$$F_{\text{hot}} = N_{\text{e,hot}}/N_{\text{e,cold}} \text{ and } T_{\text{hot}}$$

Homogeneous Volume

Five Parameters:

Transport Timescale - $\tau_{\text{transport}}$

Source of Neutrals - S_{neutrals}

Oxygen to Sulfur Ratio -

O/S_{neutrals}

Hot Electron Fraction - $F_{\text{hot}} =$

$N_{\text{e,hot}}/N_{\text{e,cold}}$

Hot Electron Temperature - T_{hot}

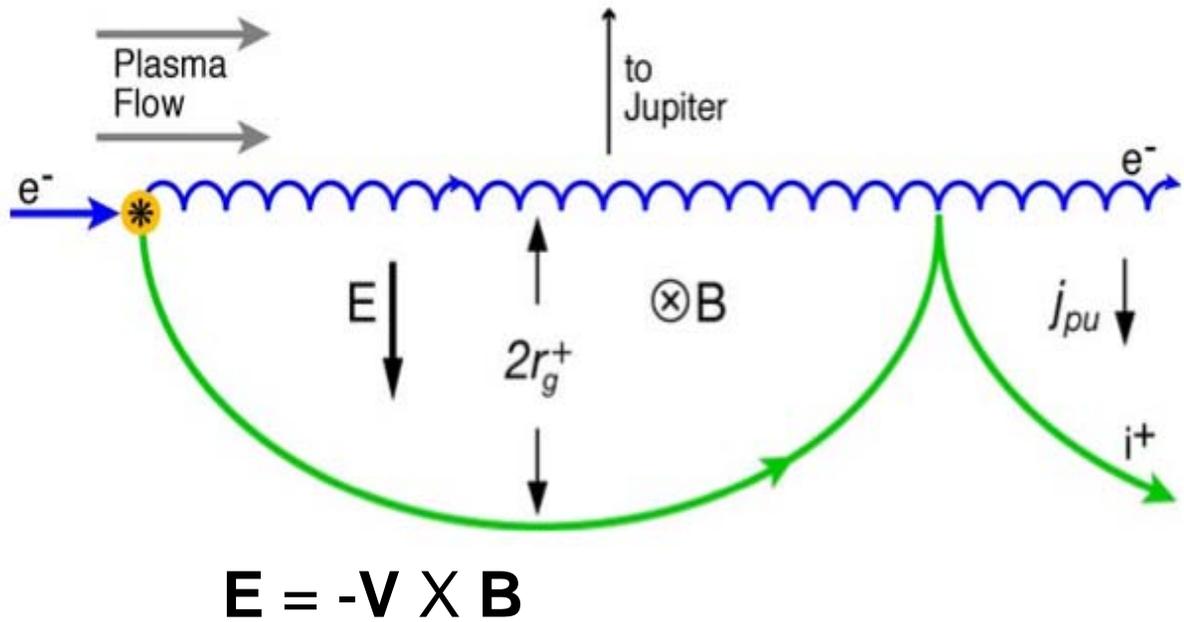

Output:

Neutral, Ion, Electron Densities

Ion Temperatures

Thermal Electron temperatures

Mass, Energy Flows

Pick-up Energy

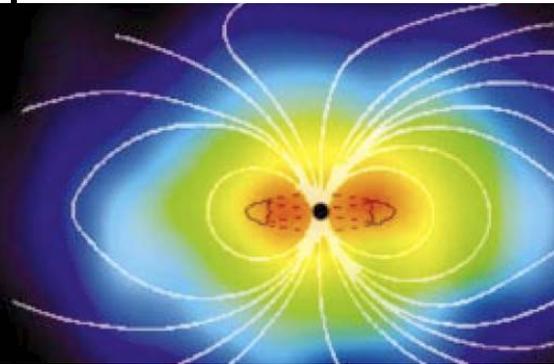

$$\mathcal{E} = \frac{1}{2} m_{\text{ion}} V^2$$

Pick-up Current

$$J_{\text{pu}} = \dot{N} e 2r_g^+$$
